

QA SYSTEM DEPLOYMENT SUMMARY REPORT

Date: June 2, 2026 **Environment:** Staging-Clone (http://13.207.185.159/) **Viewport:** 1280x960 (Desktop)

1. Executive Quality Assessment

The target system workspace replica exhibits a mature, visually accurate front-end scaffolding layers that perfectly mimics standard e-signature workflows at the 1280x960 desktop resolution. However, a deep functional evaluation reveals heavy architectural gaps and structural volatility. Multiple high-level navigational paths, interactive options, and key compliance controls operate exclusively as static, un-wired front-end placeholders. Widespread pixel-level layout drift, container overflows, and typography variances were logged, indicating that while the visual shell is close to alignment, the backend framework requires significant engineering before reaching production stability.

2. Defect Density Metrics

A rigorous audit across the active application routes successfully identified and logged **43 unique defects** after filtering out redundant system items. The logged severity levels break down as follows:

Severity Level	Logged Count	Status Impact
P1 Blocker / Critical Flow Break	5	Immediate Blocker
P2 High / Major Layout & Control	5	High Priority
P3 Medium / Normal Workspace Glitch	11	Standard Track
P4 Low / Trivial Polish & Mismatch	22	Aesthetic Pass
Total Unique Logged Defects	43	Consolidated

3. Top 5 Prioritized Structural Fixes

The following defects have been flagged for immediate engineering triage due to their severe impact on core business workflows and transactional capabilities:

Bug ID / Sev	Module / Title	Justification & Operational Impact
001 P1	Inbox / Sidebar New navigation button completely unresponsive	Completely disables the master layout scheme switcher, preventing QA or user validation of alternate system dashboards.
002 P1	Inbox / Pagination 'View all' navigation link is non-functional	Fails to break grid restrictions, locking users inside strict table rows and hiding critical contract data.
022 P1	Prepare Envelope Missing 'Date Signed' Tool in Standard Fields Tray	A critical transactional blocker. Legal compliance parameters cannot be mapped, completely halting the system sign-off cycle.
023 P1	Prepare Envelope Email Subject Input Unconstrained Overflow	Indicates missing front-end string sanitization or length restrictions. Long inputs overflow outside core panels, breaking interface formatting.
003 P2	Inbox / Data Grid Main viewport scroll bar is disabled or missing	Enforces a destructive container layout clip ('overflow: hidden'). Cuts off lower row entries below the monitor line fold.

4. Testing Boundaries & Strategy

- **Verified Scope:** Comprehensive UI alignment audits, system folder tree structures, custom multi-select checkbox states, properties panel drawers, filter bar options, and responsive performance at 1280x960.
- **Deliberately Skipped:** End-to-end cryptographic envelope hashing routes, SMTP mail distribution pipelines, relational database synchronization performance, account provisioning profiles, and mobile browser compatibility configurations.
- **Unconfirmed Suspicions:** The absolute omission of the 'Date Signed' asset module strongly implies a severe component bundle configuration error, indicating other critical drag-and-drop elements may also fail to render under deeper verification.
- **Core Assumptions:** Assumed the system baseline objective is literal layout and feature parity with standard market-leading e-signature apps, using standard user profiles under explicit credentials (**scalerailabs / QA@ScalerAILabs**).
